On the numerical solution of a transmission problem for the Klein-Gordon equation

Lebedenko Nadiya, Plakhtiy Maryan Ivan Franko National University of Lviv Faculty of Applied Mathematics and Informatics nadiykalebedenko@gmail.com, mplakhtiy@gmail.com.

In this work we consider the integral equation approach for finding a solution of a transmission problem for the Klein-Gordon equation.

Let $D \subset R^2$ a domain with the boundary $\Gamma_1 \in C^2, D_2 \subset D$ a domain with the boundary $\Gamma_2 \in C^2$. Denote $D_1 := D \setminus \overline{D_2}$. We need to find a solution to the next boundary value problem:

$$\begin{cases} \Delta u_{1} - k_{1}^{2}u_{1} = 0 & in D_{1}, \\ \Delta u_{2} - k_{2}^{2}u_{2} = 0 & in D_{2}, \\ u_{1} = u_{2} & on \Gamma_{2}, \\ k_{1} \frac{\partial u_{1}}{\partial \vartheta} = k_{2} \frac{\partial u_{2}}{\partial \vartheta} & on \Gamma_{2}, \\ u_{1} = f & on \Gamma_{1}. \end{cases}$$
(1)

Here f is a known function and k_1, k_2 are known positive constants, ϑ is the unit outward normal to the boundary. Using features of potentials, we transformed problem (1) of finding solutions u_1, u_2 in D_1, D_2 to the system of integral equations with unknown densities $\varphi_1, \varphi_2, \varphi_3$. We present the solution of (1) in the form of single layer potentials with densities $\varphi_1, \varphi_2, \varphi_3$.

$$\begin{cases} \frac{1}{2\pi} \sum_{i=1}^{2} \int\limits_{\Gamma_{i}} K_{0}(k_{1}, x, y) \varphi_{i}(y) ds(y) = f(x), & x \in \Gamma_{1}, \\ \frac{1}{2\pi} \sum_{i=1}^{2} \int\limits_{\Gamma_{i}} K_{0}(k_{1}, x, y) \varphi_{i}(y) ds(y) - \frac{1}{2\pi} \int\limits_{\Gamma_{2}} K_{0}(k_{2}, x, y) \varphi_{3}(y) ds(y) = 0, x \in \Gamma_{2}, \\ k_{1} \left(\frac{1}{2} \varphi_{2}(x) + \frac{1}{2\pi} \sum_{i=1}^{2} \int\limits_{\Gamma_{i}} \frac{\partial K_{0}(k_{1}, x, y)}{\partial \vartheta(x)} \varphi_{i}(y) ds(y) \right) - \\ -k_{2} \left(\frac{1}{2} \varphi_{3}(x) + \frac{1}{2\pi} \int\limits_{\Gamma_{2}} \frac{\partial K_{0}(k_{2}, x, y)}{\partial \vartheta(x)} \varphi_{3}(y) ds(y) \right) = 0, \quad x \in \Gamma_{2}. \end{cases}$$

Where $K_0(k_i, x, y)$ is a modified Bessel function.

Assuming that $\Gamma_i = \{x_i(s) = (x_{i1}(s), x_{i2}(s)): 0 \le s \le 2\pi\}$, i = 1, 2 are parametrized boundaries, we rewrite the system as:

$$\begin{cases} \frac{1}{2\pi} \sum_{i=1}^{2} \int_{0}^{2\pi} H_{1i}(k_{1}, s, \sigma) \mu_{i}(\sigma) d\sigma = \tilde{f}(s), \\ \frac{1}{2\pi} \sum_{i=1}^{2} \int_{0}^{2\pi} H_{2i}(k_{1}, s, \sigma) \mu_{i}(\sigma) d\sigma - \frac{1}{2\pi} \int_{0}^{2\pi} H_{22}(k_{2}, s, \sigma) \mu_{3}(\sigma) d\sigma = 0, \\ k_{1} \left(\frac{1}{2} \mu_{2}(s) + \frac{1}{2\pi} \sum_{i=1}^{2} \int_{0}^{2\pi} L_{2i}(k_{1}, s, \sigma) \mu_{i}(\sigma) d\sigma \right) - \\ -k_{2} \left(\frac{1}{2} \mu_{3}(s) + \frac{1}{2\pi} \int_{0}^{2\pi} L_{22}(k_{2}, s, \sigma) \mu_{3}(\sigma) d\sigma \right) = 0, \\ s \in [0; 2\pi]. \end{cases}$$

$$H_{ij}(k_{l}, s, \sigma) = K_{0} \left(k_{l}, x_{i}(s), x_{j}(\sigma) \right) |x'_{j}(\sigma)|,$$

$$L_{ij}(k_{l}, s, \sigma) = -k_{l} K_{1} \left(k_{l}, x_{i}(s), x_{j}(\sigma) \right) h_{ij} \left(k_{l}, x_{i}(s), x_{j}(\sigma) \right) |x'_{j}(\sigma)|,$$

$$h_{ij} \left(k_{l}, x_{i}(s), x_{j}(\sigma) \right) = \frac{\partial \left(k_{l} |x_{i}(s) - x_{j}(\sigma)| \right)}{\partial \theta(x_{i}(s))}, \quad \tilde{f}(s) = f(x_{1}(s)),$$

$$\mu_{i}(s) = \varphi_{i}(x_{i}(s)), \quad i = 1, 2, 3, \quad i, l = 1, 2. \end{cases}$$

We discretized the system using trigonometrical quadrature method with help of special functions features. As a result, we obtained a system of linear equations. The numerical solution of the transmission problem has the form

$$u_1^M(x) = \sum_{i=1}^2 \sum_{k=1}^{2M-1} \frac{H_{0i}(k_i, x, s_k)}{2M} \widetilde{\mu}_i(s_k), \quad x \in D_1,$$

$$u_2^M(x) = \sum_{k=1}^{2M-1} \frac{H_{02}(k_2, x, s_k)}{2M} \widetilde{\mu}_3(s_k), \quad x \in D_2,$$

where $H_{oi}(k, x, s_k) = \frac{1}{2\pi} K_o(k, |x - x_i(s_k)|).$

The accuracy of the method was confirmed by numerical experiments.
